## Glucosamine and Chondroitin Sulfate for Osteoarthritis of the Ki

Introduction

# Physical Therapy in Newburgh and Orange County New York for Knee Issues

Welcome to Peak Physical Therapy's guide to Glucosamine and Chondroitin Sulfate for Osteoarthritis of the K

Nonsurgical treatment of knee osteoarthritis (OA) focuses on reducing pain and maintaining or improving joint functi Doctors commonly prescribe acetaminophen and nonsteroidal anti-inflammatory drugs (NSAIDs) to relieve pain and swelling in arthritic patients. Newer NSAIDs called COX-2 inhibitors are showing promise as well.

In recent years, people with knee OA have also been taking two unique compounds. These compounds are gaining great acceptance among many doctors. Glucosamine and chondroitin sulfate are dietary supplements usually taken in pill for are thought to protect and possibly help repair cartilage cells.

Glucosamine and chondroitin sulfate are somewhat controversial treatments. While some studies have supported their effectiveness in relieving the symptoms of knee OA, the research still leaves many unanswered questions, especially a long-term effects.

#### This guide will help you understand:

- what doctors believe the supplements can do
- how the treatments are administered
- what to expect after treatment
- what is Peak Physical Therapy's approach to rehabilitation

## Anatomy

#### What part of the knee joint does OA affect?

The main problem in knee OA is degeneration of the articular cartilage. Articular cartilage is the smooth lining that co the ends of bones where they meet to form the joint. The cartilage gives the knee joint freedom of movement by decre friction.

The articular cartilage is kept slippery by joint fluid made by the joint lining (the synovial membrane). The fluid, calle synovial fluid, is contained in a soft tissue enclosure around synovial joints called the joint capsule.

An important substance present in articular cartilage and synovial fluid is called hyaluronic acid. Hyaluronic acid help collect and hold water, improving lubrication and reducing friction. It also acts by allowing cells to move and work w the joint.

When the articular cartilage degenerates, or wears away, the bone underneath is uncovered and rubs against bone, which causes pain. Small outgrowths called bone spurs, or osteophytes, may form in the joint.

## Rationale

#### What do doctors hope to achieve with these compounds?

Glucosamine and chondroitin sulfate occur naturally in the body, mainly in joint cartilage. These substances can also synthetically made and given in pill form or by injection. The theory is that these supplements can help protect, or poseven repair, damaged cartilage. Scientific studies lend support to the benefits that these supplements have on reducing swelling, and tenderness, along with improving knee joint mobility.

Laboratory experiments suggest the synovial fluid absorbs glucosamine that is introduced to the body from an external source. Glucosamine supplements also seem to encourage production of hyaluronic acid. Doctors think that normal hyaluronic acid levels in the knee joint keep the cartilage healthy and suppress pain in patients with knee OA.

Glucosamine and chondroitin sulfate also help fight inflammation, which in turn reduces joint pain, swelling, and tend from knee OA. These compounds seem to work in a different way than NSAIDs. They take longer to achieve the sam benefit, but the results tend to last longer than NSAIDs. Most importantly, they have fewer side effects than NSAIDs. possible that some patients may get good pain relief with a combination of the two.

Though the data isn't conclusive, these two supplements have been shown to decrease pain and improve joint mobility patients with knee OA. In a recent study, knee pain from OA was found to decrease mostly in those people suffering from oderate to severe pain, but not those suffering with just mild pain. Most people start to notice a difference after takin supplements for four weeks. Maximum benefits happen by eight to 12 weeks, and the benefits seem to last even after treatment has ended. It is usually recommended that glucosamine and chondroitin sulfate can be taken indefinitely as as one feels that there is relief from symptoms in their affected joints. Long term use (longer than 3 months), however be discussed with your doctor to ensure it is safe in each individual case. Studies to support the effectiveness and safe term use of these supplements are ongoing.

## Preparation

#### How will I prepare for treatment?

It is best to prepare for this treatment by talking to your doctor and gathering any information regarding these supplements for yourself. Organizations in your area that deal with arthritis can be useful (i.e. the Arthritis Foundation of your cours Not all forms of arthritis respond to these supplements and taking care of knee OA can involve many possible treatment including treatment with Physical Therapy. Glucosamine and chondroitin sulfate are not magic bullets. They are one treatment in a comprehensive approach to knee OA.

## **Procedure and Complications**

#### How are these treatments administered?

Doctors commonly prescribe oral glucosamine in doses of 500 milligrams three times per day or 1,000 milligrams twi day. A patient may get a quicker response with a higher dosage. Obese patients may require higher dosages. Most stud chondroitin sulfate use a dosage of 1,200 milligrams daily.

# Complications

#### What might go wrong?

One potential benefit beyond pain relief for both glucosamine and chondroitin sulfate seems to be that patients experied fewer side effects with these drugs than with NSAIDs.

Most people can take these supplements without complications. Some people, however, complain of gastrointestinal problems, which clear up when patients stop taking the supplement. Although rare, negative reactions may include nat and vomiting, headache, painful digestion, softened or loose stool, abdominal pain, heartburn, throbbing or fluttering of heart, skin reaction, edema (swelling), and discomfort in the legs.

Patients who take numerous medications should seek the advice of their doctor before supplementing with glucosamin chondroitin sulfate. As glucosamine sulfate affects the way insulin works, diabetics are encouraged to monitor their be glucose levels carefully and to alert their doctor of any marked changes. Also, children, pregnant women, and patients are on blood thinners should only take chondroitin sulfate with the approval of their doctor.

## After Care

#### What happens after treatment?

Many patients report ongoing benefits, even after they stop taking these supplements. Past studies have shown that the of these compounds to fight inflammation may be slower to take effect than NSAIDs yet the benefits seem to outlast NSAIDs. Until further studies are completed it cannot be said that there is proof to show that these supplements rebuil damaged cartilage. Given the possible protection to the cartilage, however, some doctors have their patients use these supplements in hopes of maintaining joint health.

## Rehabilitation

Although glucosamine and chondroitin sulfate appear to have a useful place in treating knee OA, it is not recommende be used alone without any other concurrent treatment. Managing knee OA works best when combined with Physical T and lifestyle changes, such as weight loss, and increasing your overall physical fitness.

At Peak Physical Therapy we believe that the more you understand about OA, the more effective our treatment will be this reason, we will assist you in learning about OA so you can understand how best to manage your own symptoms.

Regular treatment at Peak Physical Therapy can significantly decrease the pain you feel from your OA knee. The use as well as electrical modalities such as ultrasound or interferential current may be used to alleviate your initial symptomay also be a useful depending on individual preference and the stage of the OA. Many patients instead find heat to b particularly soothing on their arthritic joint. Anecdotally, warmer weather often decreases the symptoms of knee OA, whereas cold weather may increase them. This is one reason why many older patients with OA in their joints flock to climates when the colder seasons arrive. Massage to the muscles of the thigh or calf may also be used to aid in pain re Acupuncture is gaining popularity as a form of treatment for knee osteoarthritis, and as a result, more studies are being to validate its effectiveness.

By decreasing the pain you have, it will make it easier for you to do range of motion and strengthening exercises. Kne of motion often declines as OA progresses so exercises to maintain both the bending and straightening of the knee are important. Your Physical Therapist will teach you exercises that you can do in the clinic, as well as part of your home program. Using an exercise bike, whether stationary or regular, is a good way to maintain some of the range of motion knee and keep the joint loose. However, because maximum range of motion is not used during cycling, specific exercise move the knee from full bending to full straightening are still required. There may be a small amount of discomfort as knee nears the end of the bending or straightening range and this should be respected while still working through your maximum available range. If needed, your Physical Therapist will assist you in gaining range of motion by mobilizing joint. This hands-on technique helps to encourage the knee joint to move gradually into the end ranges of motion.

In addition to range of motion exercises, your Physical Therapist will teach you strengthening exercises for the knee a The hip is particularly important as it controls the alignment of the knee so weakness in this area in particular leads to forces being put through the knee during everyday activities such as walking or stepping up or down. OA can affect b sides of the knee joint but in many cases the knee cartilage wears down on one side (typically the medial or inside of knee) quicker than the other side, which then significantly affects the alignment of your knee. Your Physical Therapis use an electrical muscle stimulator on the muscles around the knee or hip to encourage the muscles in these areas to fi which supports your joints, improves your alignment, and therefore takes the pressure off of your painful knee. Light or elastic bands may also be used to add increased resistance and build up the strength.

Alignment can also be improved by implements such as wedged foot orthotics or knee braces. Wedged orthotics chan ground forces that are applied upwards to your knee and specialized knee braces are designed to unload the pressure of the most painful side of your knee. Another way to unload the pressure on your knee is to use a cane or walking stick. Research has shown that the use of a cane in the hand that is opposite to your painful knee will decrease the forces appyour knee and may therefore decrease your pain. On that note, if you are carrying heavy goods, carrying them on the side as your OA knee instead of in the opposite hand will put the least amount of pressure on your painful joint. Your Physical Therapist at Peak Physical Therapy will assess your knee and determine if your knee would benefit from the orthotics, a brace, or a walking aid, and will refer you to the appropriate health care professionals to assist you with of these items.

If you are overweight, losing some weight can also take pressure off of your painful knee. Any extra weight that the b carries will put direct pressure on your OA knee and increase the amount of pain you feel and hasten the process of jo deterioration.

Your Physical Therapist will encourage weight loss through both dietary changes as well as strength training, and cardiovascular activities such as walking (if tolerable), stationary or ordinary cycling, or pool activities such as swimm water aerobics. The pool is a particularly good venue to partake in cardiovascular activities for weight loss as well as j many of the exercises your Physical Therapist prescribes for range of motion and strengthening. The water naturally t some of the pressure off of your joint and therefore many patients with OA find the water particularly therapeutic especifies the water is warmer than usual public pool temperature.

The final part of our treatment will include exercises for your balance. As the result of any injury or pain the receptors your joints and ligaments that assist with balance and proprioception (the ability to know where your body is without at it) decline in function. This is true with OA knees as well. Your Physical Therapist at Peak Physical Therapy will p exercises for you to regain and maintain this balance and proprioception. This might include exercises such as standin one foot or balancing with both feet on an unstable surface such as a pillow or a soft plastic disc. Depending on the stay your OA and your ability, your Physical Therapist may even prescribe agility exercises such as gentle hopping or movide to side.

Fortunately, most patients with knee OA who combine the use of glucosamine and chondroitin sulfate with our rehability program at Peak Physical Therapy feel that their pain decreases, they are better able to manage their symptoms, and at able to improve their activity level and quality of life. If, however, your knee does not respond as we would expect to treatment we provide at Peak Physical Therapy, we will promptly liaise with your doctor regarding the best managem to assist you.

Peak Physical Therapy provides services for Physical Therapy in Newburgh and Orange County New York.
